Foreword

Over the years, the issue of turbulence has attracted the attention and skills of many researchers, maybe because of the complexity of turbulent flow and the challenge that its understanding represents for scientists. Between the von Karman analytical expression for turbulent boundary layers profiles and the analysis of the results of Direct Numerical Simulation (DNS), this understanding has considerably progressed. Among the different regions of the boundary layer, the wall region is particularly challenging because the dimensions are getting so small that it is difficult to investigate it experimentally.

Wallturb, a European Synergy for the Assessment of Wall turbulence, is the first European Commission funded collaborative project that addresses near wall turbulence. During more than 4 years, 16 European partners have collaborated on this topic.

The project generated considerable amount of new data, from both experiments and DNS computations. Improved measurement techniques (e.g. high resolution Particle Image Velocimetry), high density time resolved instrumentation and scaled up experiments gave researchers access to a level of detail never achieved before. A number of test cases were investigated, including the presence of adverse pressure gradients and separated flows. Thanks to the availability of large computing resources, DNS computations could be carried out at levels of Reynolds number never computed before. All the data generated was made available for researchers in the form of databases.

In parallel, other groups were working on the turbulence modelling aspects including Reynolds Average Navier–Stokes methods (RANS), Large Eddy Simulation (LES) as well as an innovative Low Order Dynamical Systems method (LODS). Comparison between experiments and computations highlighted strengths and weaknesses of the different approaches.

But what is the rationale for a better understanding and for improved prediction methods if these are not used for practical applications? This is where the two industrial members of the consortium brought their needs and a challenging application: the prediction of the friction coefficient, which is directly dependent on the velocity profile at the wall, around the wing of an aircraft. Accurate prediction of the friction coefficient means accurate prediction of drag and thus of fuel consumption.

Wallturb has demonstrated that the (sometimes turbulent) mixing of academia, research centres and industry, and, the associated diversity of views and approaches, resulted in the creation of new knowledge and a realisation that the fertility of applied research is dependent on knowledge created by more upstream research. The project has clearly contributed to pushing the boundaries of understanding closer to the wall, at higher levels of Reynolds numbers and under conditions representative of aeronautical applications. This has led to a better accuracy of the different prediction methods, ranging from those used in academia to those used in industry.

The final workshop was the occasion to share this new knowledge developed in the frame of European cooperation with other parts of the world, whose representatives acknowledged the high quality and innovativeness of the work performed. These proceedings of the final workshop attest to the quality of the work and advances that have been achieved during the project.

Preface

This book is gathering the contributions of most of the participants to the WALLTURB workshop on “Understanding and modelling of wall turbulence” held in Lille (France) on April 21st to 23rd 2009.

This workshop was organized by the WALLTURB consortium, as a final open workshop of the WALLTURB project, in order to present to the relevant scientific community the main results of the project and to stimulate scientific discussions around the subject of wall turbulence.

The workshop assembled 105 participants from all over the world, 7 invited lecturers and 46 contributions from which 27 were presented by the WALLTURB consortium as an output of the WALLTURB project.

This workshop was an opportunity to review the recent progress in theoretical, experimental and numerical approaches to wall turbulence. The problems of zero pressure gradient, adverse pressure gradient and separating turbulent boundary layers were addressed in detail with the three approaches, using most advanced tools in each of them.

This book is gathering papers from most of the contributors to the workshop. It is aimed as being a milestone in the research field, thanks to the high level of the invited speakers and the involvement of the contributors. It is also aimed at being a testimony of the achievement of the WALLTURB project.

Contents

The WALLTURB Project	1
Michel Stanislas, Javier Jimenez, and Ivan Marusic	
Invited Speakers	
The Law of the Wall. Indications from DNS, and Opinion	9
Philippe R. Spalart	
A Web-Services Accessible Turbulence Database and Application to A-Priori Testing of a Matrix Exponential Subgrid Model	21
Charles Meneveau	
Modeling Multi-point Correlations in Wall-Bounded Turbulence	29
Robert D. Moser, Amitabh Bhattacharya, and Nicholas Malaya	
Theoretical Prediction of Turbulent Skin Friction on Geometrically Complex Surfaces	39
Pierre Sagaut and Yulia Peet	
Scaling Turbulent Fluctuations in Wall Layers	51
Ronald L. Panton	
Session 1: The WALLTURB LML Experiment	
The WALLTURB Joined Experiment to Assess the Large Scale Structures in a High Reynolds Number Turbulent Boundary Layer	65
Joel Delville, Patrick Braud, Sebastien Coudert, Jean-Marc Foucaut, Carine Fourment, W.K. George, Peter B.V. Johansson, Jim Kostas, Fahrud Mehdi, A. Royer, Michel Stanislas, and Murat Tutkun	

Calibration of the WALLTURB Experiment Hot Wire Rake with Help of PIV	75
Michel Stanislas, Jean-Marc Foucaut, Sebastien Coudert, Murat Tutkun, William K. George, and Joel Delville	
Spatial Correlation from the SPIV Database of the WALLTURB Experiment	85
Jean-Marc Foucaut, Sebastien Coudert, Michel Stanislas, Joel Delville, Murat Tutkun, and William K. George	
Two-Point Correlations and POD Analysis of the WALLTURB Experiment Using the Hot-Wire Rake Database	95
Murat Tutkun, William K. George, Michel Stanislas, Joel Delville, Jean-Marc Foucaut, and Sebastien Coudert	
Session 2: Experiments in Flat Plate Boundary Layers	
Reynolds Number Dependence of the Amplitude Modulated Near-Wall Cycle	105
Ivan Marusic, Romain Mathis, and Nicholas Hutchins	
Tomographic Particle Image Velocimetry Measurements of a High Reynolds Number Turbulent Boundary Layer	113
Callum Atkinson, Sebastien Coudert, Jean-Marc Foucaut, Michel Stanislas, and Julio Soria	
Study of Vortical Structures in Turbulent Near-Wall Flows	121
Sophie Herpin, Sebastien Coudert, Jean-Marc Foucaut, Julio Soria, and Michel Stanislas	
Session 3: Experiments in Adverse Pressure Gradient Boundary Layers	
Two-Point Near-Wall Measurements of Velocity and Wall Shear Stress Beneath a Separating Turbulent Boundary Layer	135
Paul Nathan and Philip E. Hancock	
Experimental Analysis of Turbulent Boundary Layer with Adverse Pressure Gradient Corresponding to Turbomachinery Conditions . .	143
Stanislaw Drobnik, Witold Elsner, Artur Drozd, and Magdalena Materny	
Near Wall Measurements in a Separating Turbulent Boundary Layer with and without Passive Flow Control	151
Davide Lengani, Daniele Simoni, Marina Ubaldi, Pietro Zunino, and Francesco Bertini

Session 7: RANS Modelling

- A Nonlinear Eddy-Viscosity Model for Near-Wall Turbulence** 269
B. Anders Pettersson Reif and Mikael Mortensen

- ASBM-BSL: An Easy Access to the Structure Based Model Technology** . 277
Bertrand Aupoix, Stavros C. Kassinos, and Carlos A. Langer

- Introduction of Wall Effects into Explicit Algebraic Stress Models
Through Elliptic Blending** 287
Abdou G. Ocen, Rémi Manceau, and Thomas B. Gatski

Session 8: Dynamical Systems

- POD Based Reduced-Order Model for Prescribing Turbulent Near Wall
Unsteady Boundary Condition** 301
Guillaume Lehnasch, Julien Jouanguy, Jean-Philippe Laval, and
Joel Delville

- A POD-Based Model for the Turbulent Wall Layer** 309
Bérengère Podvin

- HR SPIV for Dynamical System Construction** 317
Jean-Marc Foucaut, Sébastien Coudert, and Michel Stanislas

- The Stagnation Point Structure of Wall-Turbulence and the Law
of the Wall in Turbulent Channel Flow** 327
Vassilios Dallas and J. Christos Vassilicos

Session 9: Large Eddy Simulation

- Wall Modelling for Implicit Large Eddy Simulation of Favourable
and Adverse Pressure Gradient Flows** 337
ZhenLi Chen, Antoine Devesa, Michael Meyer, Eric Lauer,
Stefan Hickel, Christian Stemmer, and Nikolaus A. Adams

- LES of Turbulent Channel Flow with Pressure Gradient Corresponding
to Turbomachinery Conditions** 347
Witold Elsner, Lukasz Kuban, and Artur Tyliczszak

- LES Modeling of Converging Diverging Turbulent Channel Flow** 355
Jean-Philippe Laval, Witold Elsner, Lukasz Kuban, and
Matthieu Marquillie

- Large-Scale Organized Motion in Turbulent Pipe Flow** 365
Sebastian Große, Dirk Jan Kuik, and Jerry Westerweel

Session 10: Skin Friction

Near-Wall Measurements and Wall Shear Stress 377
 T. Gunnar Johansson

Measurements of Near Wall Velocity and Wall Stress in a Wall-Bounded Turbulent Flow Using Digital Holographic Microscopic PIV and Shear Stress Sensitive Film 385
 Omid Amili and Julio Soria

Friction Measurement in Zero and Adverse Pressure Gradient Boundary Layer Using Oil Droplet Interferometric Method 393
 Philippe Barricau, Guy Pailhas, Yann Touvet, and Laurent Perret

Session 11: Modified Wall Flow

Scaling of Turbulence Structures in Very-Rough-Wall Channel Flow 405
 David M. Birch and Jonathan F. Morrison

Characterizing a Boundary Layer Flow for Bubble Drag Reduction 413
 Marc Harleman, René Delfos, Jerry Westerweel, and Thomas J.C. van Terwisga

Direct and Large Eddy Numerical Simulations of Turbulent Viscoelastic Drag Reduction 421
 Laurent Thais, Andres E. Tejada-Martínez, Thomas B. Gatski, Gilmar Mompean, and Hassan Naji

DNS of Supercritical Carbon Dioxide Turbulent Channel Flow 429
 Mamoru Tanahashi, Yasuhiro Tominaga, Masayasu Shimura, Katsumi Hashimoto, and Toshio Miyauchi

Session 12: Industrial Modeling

Evaluation of v^2-f and ASBM Turbulence Models for Transonic Aerofoil RAE2822 439
 Jeremy J. Benton

Turbulence Modelling Applied to Aerodynamic Design 451
 Vincent Levasseur, Sylvain Joly, and Jean-Claude Courty
