- 4 Summary

What are Multiword Expressions (MWEs)?

- *Definition:* A **multiword expression** (“MWE”) is:
 - ① decomposable into multiple simplex words
 - ② lexically, phonetically, morphosyntactically, semantically, and/or pragmatically idiosyncratic

Adapted from Baldwin and Kim [2010]

Some Examples

- *Mt Rokko, ad hoc, by and large, Toy Story, kick the bucket, part of speech, in step, Hanshin Tigers, trip the light fantastic, telephone box, call (someone) up, take a walk, do a number on (someone), take advantage (of), pull strings, kindle excitement, fresh air,*

Lexical Idiomaticity

- Lexical idiomaticity = one or more of the elements of the MWE does not have a usage outside of MWEs
- Examples of lexical idiomaticity:
ad hominem, bok choy, a la mode, to and fro
- Complications of lexical idiomaticity:
 - ▶ cross-linguistic effects, e.g. *ad* is unmarked in Latin
 - ▶ simple lexical occurrence outside of MWEs not sufficient, e.g. *a la mode*

Morphosyntactic Idiomaticity

- Morphosyntactic idiomaticity = the morphosyntax of the MWE differs from that of its components
- Examples of morphosyntactic idiomaticity:

cat's cradle, yin hry "evil eye"

- Examples of syntactic idiomaticity:

MWEs and Productivity

- MWEs populate a spectrum of productivity, from completely unproductive, lexicalised MWEs such as *by and large* to highly productive (but still semi-lexicalised) MWEs such as English verb–particle constructions
- The first question in terms of the grammar–lexicon interface when it comes to MWEs, is the degree of productivity of a given MWE, to determine whether it is possible to enumerate all of the instances of a given MWE class, or if not, what the rules that govern the productivity of the MWE are

MWEs and Syntactic Flexibility

- The next question is what degree of morphosyntactic flexibility the (open or closed) class of MWEs has:
 - ▶ if none, treat as a “word-with-spaces” and map onto a pre-existing type in the grammar, where possible
 - ▶ if only morphological flexibility (e.g. *attorney general*), capture this appropriately and map to a type in the grammar
 - ▶ if morphosyntactic flexibility, ascertain the level of flexibility; most MWEs are somewhat constrained in their morphosyntactic flexibility, but working out the precise limits of flexibility is notoriously difficult (suggest erring on the side of under-constraint)
- Beware metalinguistic markers such as *proverbial*

Idioms

- Idioms are a fascinating class of MWE, in that they take many different forms lexically and syntactically, with syntactic flexibility determined through “decomposability” [Nunberg et al., 1994, Baldwin et al., 2003]:
 - ▶ if the semantics of the idiom can be (idiosyncratically) ascribed to parts of the MWE, those parts will tend to undergo (almost) unlimited syntactic flexibility
spill the beans = reveal' (secret') \approx
spill' (beans')
 - ▶ one approach of dealing with this in the grammar is to have an idiomatic lexical entry associated with each of the decomposed components, and constrain idiomatic parses to have all of the idiom parts in particular relational configurations

 - Analyses
- 4 Summary

Definition

- Determinerless PPs (“PP–Ds”) are MWEs comprising a preposition (P) and a singular noun (N_{Sing}) without a determiner:

Institution	Media	Metaphor	Temporal	Means/Manner
<i>at school</i>	<i>on film</i>	<i>on ice</i>	<i>at breakfast</i>	<i>by car</i>
<i>in church</i>	<i>on TV</i>	<i>at large</i>	<i>at lunch</i>	<i>by train</i>
<i>in gaol</i>	<i>to video</i>	<i>at hand</i>	<i>on break</i>	<i>by hammer</i>
<i>on campus</i>	<i>off screen</i>	<i>at leave</i>	<i>by night</i>	<i>by computer</i>
<i>at temple</i>	<i>in radio</i>	<i>at liberty</i>	<i>by day</i>	<i>via radio</i>
...

The Syntax of PP–Ds

- Variability in syntactic markedness, productivity and nominal modifiability for different PP–D constructions
- Non-productive, non-modifiable PP–Ds: *ex cathedra*, *ad hominem*, *ad nauseum*
- Fully-productive, highly-modifiable PP–Ds: *per recruited student that finishes the project*
- Most PP–Ds lie between these two extremes

Source(s): Ross [1995]

Syntactic Markedness

- Syntactically-unmarked PP–Ds: N_{Sing} is uncountable
E.g. Institutions: *in school*, *in gaol*, but **in library* (cf. *school finished* vs. **library finished*)
- Syntactically-marked PP–Ds: N_{Sing} is strictly countable
E.g. PPs headed by *per*: *per person*, but **per information* (c.f. *by bus/public transport*)

Nominal Modifiability

- No modification: *in *mental/*small hospital*
- Idiosyncratic modification: *at long/*lengthy/*short last*
- Relatively free modification: *at great/considerable/tedious length*
- Modification seldom unrestricted, except for fully productive prepositions (e.g. *by*)

Types of Modification in PP–Ds

- Modification can be:
 - ▶ impossible, optional or obligatory
 - ▶ nominal, adjectival or both (or none)

	Obligatory	Optional	Impossible
Noun	<i>at *(eye) level</i>	<i>on (summer) vacation</i>	<i>on (*very) top</i>
Adjective	<i>at *(long) range</i>	<i>in (sharp) contrast</i>	
Either	<i>at *(company) expense</i> <i>at *(considerable) expense</i>	<i>in (family) court</i> <i>in (open) court</i>	

Contents

- 1 Introduction
- 2 MWEs at the Grammar–Lexicon Interface
- 3 A Case Study: English Determinerless PPs
 - Problem Statement
 - **Analyses**
- 4 Summary

Analysis 1: Lexical Listing

- **Analysis:** all PP–Ds fully lexicalised
- **Pros:**
 - ▶ effective at capturing syntactically- and semantically-marked PP–Ds
- **Cons:**
 - ▶ unable to handle nominal modification
 - ▶ data sparseness effects with productive classes
 - ▶ inability to capture semantic compositionality

Analysis 2: Simple Combination

- **Analysis:** use head complement rule to combine simplex P and N lexical entries
- **Pros:**
 - ▶ Effective at capturing syntactically-unmarked PP–Ds
 - ▶ Licenses unconstrained nominal modification
- **Cons:**
 - ▶ Inability to capture non-compositional semantics
 - ▶ Overgeneration (**by/on/... school*)

Analysis 3: Idiosyncratic Selection

- **Analysis:** introduce idiosyncratic lexical types for head nouns which specify constraints such that:
 - ① phrases that it projects will only appear as complements of (certain) Ps;
 - ② its specifier (determiner) will never be expressed
 - ③ it must combine with a (pre-head) modifier before it can combine with the P; and
 - ④ it can only appear with particular modifier types (e.g. only nouns)

Analysis 3: Idiosyncratic Selection

- Example for *at eye/street/... level*:

```
level_i_n1 := n_-_c-brn_le &
[ STEM < "level" >,
  SYNSEM [ LKEYS.KEYREL.PRED "_level_n_1_rel",
           PHON.ONSET con ] ].
```

```
at+level := detless_pp_idiom_mtr &
[ INPUT.RELS <! [ PRED _at_p_rel ],
               [ PRED "_level_n_1_rel" ],
               [ PRED idiom_q_i_rel ] !> ].
```

Analysis 3: Idiosyncratic Selection

- **Pros:**

- ▶ captures idiosyncracies of modifiability, P-N collocation

- **Cons:**

- ▶ lexical redundancy
- ▶ overgeneration

Analysis 4: \bar{N} Selection

- **Analysis:** allow particular P senses (e.g. *by* MEANS) to select for unsaturated NPs (\bar{N} s)
- **Pros:**
 - ▶ allows for nominal modification and full productivity
- **Cons:**
 - ▶ semantic restriction of the noun?

(Dutch) *in* CLOTHING vs. *by* MEANS

$$\left[\text{SYN} \left[\text{CAT} \left[\text{HEAD } \textit{prep} \text{ VAL} \left[\text{COMPS} \left\langle \left[\text{SPR} \left\langle \text{Det} \right\rangle \right] \right\rangle \right] \right] \right] \right]$$

Analysis 4: \bar{N} Selection

Determining the Appropriate Analysis

- Consider:
 - ▶ degree and type of nominal modifiability
 - ▶ productivity relative to a given P
 - ▶ semantic markedness
 - ▶ NP saturation (syntactic markedness)

 - Problem Statement
 - Analyses
- 4 Summary

Summary

- MWEs populate a broad spectrum, in terms of productivity, constructional composition, morphosyntactic flexibility, ...
- Important to understand the full complexities of the data, to be able to customise the syntactic analysis to the MWE
